

## Frequently Asked Questions:

**Q: Is there a GhostBlind Dealer in my area?**

A: GhostBlind Industries is currently setting up dealers in the US. Call your local hunting store to see if they carry the GhostBlind Predator. Check out the GhostBlind [Dealer Locator](#)

**Q: How does it work?**

A: The GhostBlind® Predator mirror the ground in front of the blind; approximately 6-8' out from the base of the blind. See [Videos](#) for real life examples.

**Q: Does the GhostBlind® reflect the sun? (This is our most frequently asked question)**

A: The design angles of the mirrors can only reflect the sun to the ground. When set up, the panels are always angled forward eliminating the possibility of the sun reflecting back to game. Many of the pictures and videos you see on this site are in the direct sunlight, with the sun facing the mirror panels. If you set up the blind on a slope or hill, as with any ground blind, you should not set it at the top of the hill as this will cause sillouitting. If you move down the hill a little, the blind will set up with the angle of the slope, thereby eliminating the sun reflecting back to the game. [See illustration.](#)

**Q: Can game see itself in the mirror panels?**

A: No - unless the game gets within 3' - 5' of the blind before you shoot.

**Q: Won't the sun reflect off of the blind when carrying in the woods and spook game?**

A: No - the GhostBlind® folds with all mirror panels to the inside, with camouflage showing on the outside. It is impossible for the blind to reflect sunlight while in a folded position.

**Q: If there is a shadow on the ground in front of the blind, would it cause the image in the mirror to appear darker than the surrounding environment and spook game?**

A: Yes, it could appear darker but it won't spook game. Keep in mind that there are shadows caused by trees and clouds everywhere. Game does not rationalize why a shadow may appear in one place or another. Example - we have all seen fast moving clouds moving across the sky and causing shadows to move quickly across a field. Have you ever seen these shadows chasing a heard of spooked animals? Note - If the GhostBlind were square or had a straight top, and appeared darker, then game could notice a strange structure and get spooked. This is one of many reasons why the blind is shaped the way it is.

**Q: Will the wind blow the blind over?**

A: No - use the included tent stakes and string to secure to the ground. In extremely windy conditions, you may want to add extra tie down strings. Keep in mind that the blind only weighs 12 pounds and it will move in a strong wind even if it is tied down. This will not reduce the effectiveness of the blind as everything around the blind is also moving in the wind. Game can not rationalize as to why certain branches or grass are blowing one direction and blowing differently in another area. The important thing to remember is that everything is moving. See Instructions for tie downs.

**Q: Can the mirrors be scratched or damaged?**

A: Yes. In order to make the blind lightweight, flexible and unbreakable they are made of plastic. The reflective panels will eventually have small scratches and pits which is to be expected. These marks will not reduce the effectiveness of your blind. Game will never see these marks. Glass mirrors would be more scratch resistant but they would break, weigh about 50lbs and would cost over \$500 to make a blind. All mirrors are folded to the inside and protected when transporting.

**Q: Will the mirror panels warp in the hot sun?**

A: Yes, in some circumstances. If the hot sun is shining on the backside of the blind, it will heat the plastic and cause it to expand on that side, causing the panel to warp forward a little at the top. This will not reduce the effectiveness of your blind as it will only bend the image in the mirror (similar to a funhouse mirror). Animals cannot rationalize that the image looks funny. When the temperature equalizes on both sides of the panel or you take it out of the sun, the panel will return to its normal state. This will also happen temporarily when you take the blind from a warm house into cold temperatures. Once the entire blind reaches the same temperature, it will remain straight.

**Q: How heavy is the blind?**

A: The latest version of the GhostBlind® Predator only weighs 12lbs

**Q: How big is the blind?**

A: The GhostBlind® Predator is 102" wide and 46" high

**Q: Is the blind hard to carry?**

A: It is very easy to carry with an included shoulder strap. We have an optional Deluxe Carry Bag that is custom fit to the blind that has a "Total Gear Carry System®" where you can attach all of your gear including, back pack, chair and more. See [Total Gear Carry System®](#).

**Q: Can the blind get wet?**

A: Yes - The reflective panels and backside are water resistant. We highly recommend the blind should be dried out after hunting to eliminate mildew. [See instructions](#)

**Q: Can I leave the blind out overnight?**

A: You can, but we do not recommend you leave your blind outside overnight or set up for extended periods of time for several reasons. When you return in the morning you could have excessive moisture, condensation or even ice on the mirror surface. The GhostBlind® is water resistant, not water proof and should be dried out after use. Keep in mind that extreme heat and extreme sun exposure will shorten the live expectancy of just about anything. Example - even though fabric ground blinds are intended to be left outdoors, the extreme sun exposure will break down the fabric very quickly and shorten the life expectancy. If you feel you must leave your blind outdoors you should always fold it up and keep it in one of our carry bags. Common sense should be use to extend the life expectancy of your blind.

**Q: Is it ok to leave the blind in my car or truck in the hot sun?**

A: Yes - special care should be taken to lay your GhostBlind® flat in your car or truck to keep from warping the panels in the extreme heat. If the panels should become warped, you can simply lay it flat for a short period of time to straighten the panels. Keep in mind that extreme heat and extreme sun exposure will shorten the live expectancy of just about anything. Example - even though fabric ground blinds are intended to be left outdoors, the extreme sun exposure will break down the fabric very quickly. Due to the lightweight portability of the GhostBlind, it is always best to take it with you at the end of your hunting day. Common sense should be use to extend the life expectancy of your blind.
